

Aspen Everclear Drinkware complies with the EU regulations and standards for safe use.

What is BPA?

BPA (Bisphenol A) is a chemical used in the manufacture of polycarbonate plastics and epoxy resins.

Should I be concerned about BPA in Aspen™ drinkware?

Aspen products have been independently tested for the migration of BPA. Test results show that Aspen is fully compliant and the levels of BPA do not exceed the specific migration limit in relation to food contact and plastics stated in the European Commission regulations.

Why should I use Aspen™ Polycrystal?

BPA is an essential component in the manufacture of Polycrystal, allowing the drinkware to be virtually unbreakable whilst also having superior clarity over other plastic glasses. Aspen™ is dishwasher safe as well as being suitable for storage in fridge or freezers. All these attributes make Aspen™ drinkware an excellent choice as a glass alternative.
